## **REGIONAL DIVISION III**

### **45<sup>th</sup> ANNUAL REGIONAL CONVENTION**

## **Land Sector Modernization Cadastral Survey Records Reconstruction (LandS Mode: CadSRR)**

D.L.M. Bool, V.L.DL. Azucena, L.P. Balicanta & J.L.D. Fabila

**Deane Leonard M. Bool**

Research Associate

Training Center for Applied Geodesy and Photogrammetry

University of the Philippines

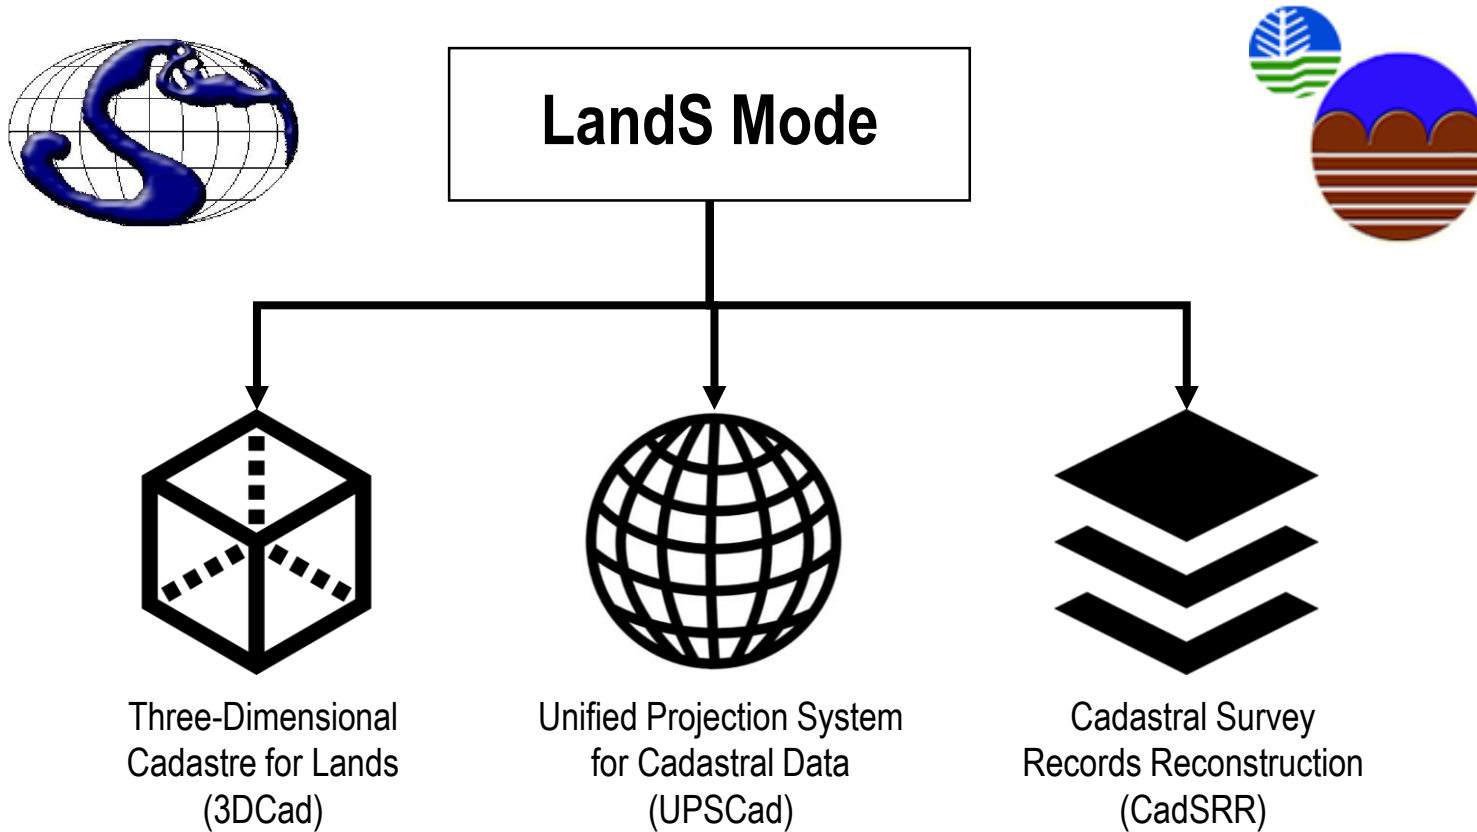

**[dmbbool@up.edu.ph](mailto:dmbbool@up.edu.ph)**

# GeoSurvLAV

# LandS Mode

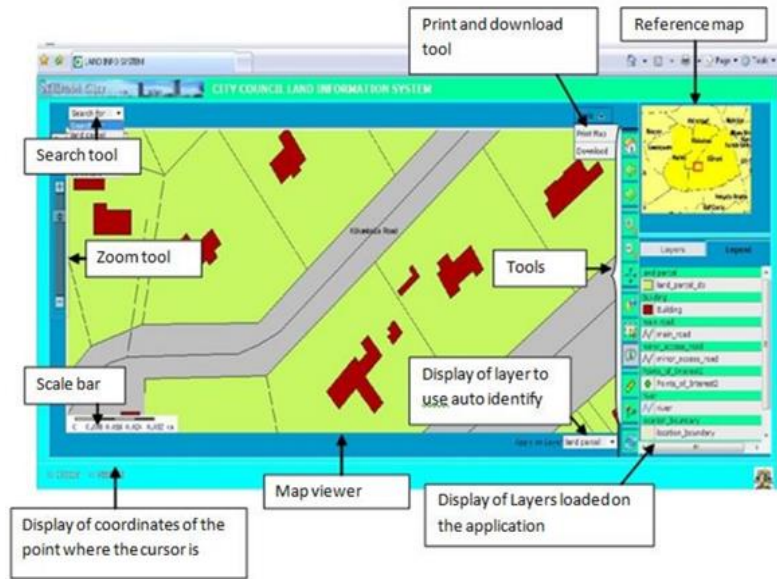

# CADSRR: Objectives

- Come up with processes and methodologies in the Cadastral data reconstruction activities
- Use GIS-Based software in handling and processing lot data

# CADSRR: RE<sub>x</sub>

## NAIROBI City LIS (Kenya)

- QGIS was employed to process data and create the digital map.
- Output were stored into a database created using PostgreSQL and PostGIS. The database provides tools for data updating and visualization.
- The system contained information on parcel ownership, land use, taxation, location boundary, land value, encumbrance, etc.

# CADSRR: RE<sub>x</sub>

## Cadastral Survey Reconstruction (Kosovo)

- The graphical cadastral data was compared with the alpha-numeric data in relation to the presence or completeness of the documents based on the:
  - *No. of parcels in the graphical evidences*
  - *No. of parcels in the textual evidences*
  - *No. of parcels that are not recorded or documented in the registries (but exists in the locality).*
  
- The georeferencing and vectorization of scanned cadastral maps were done using a GIS software.

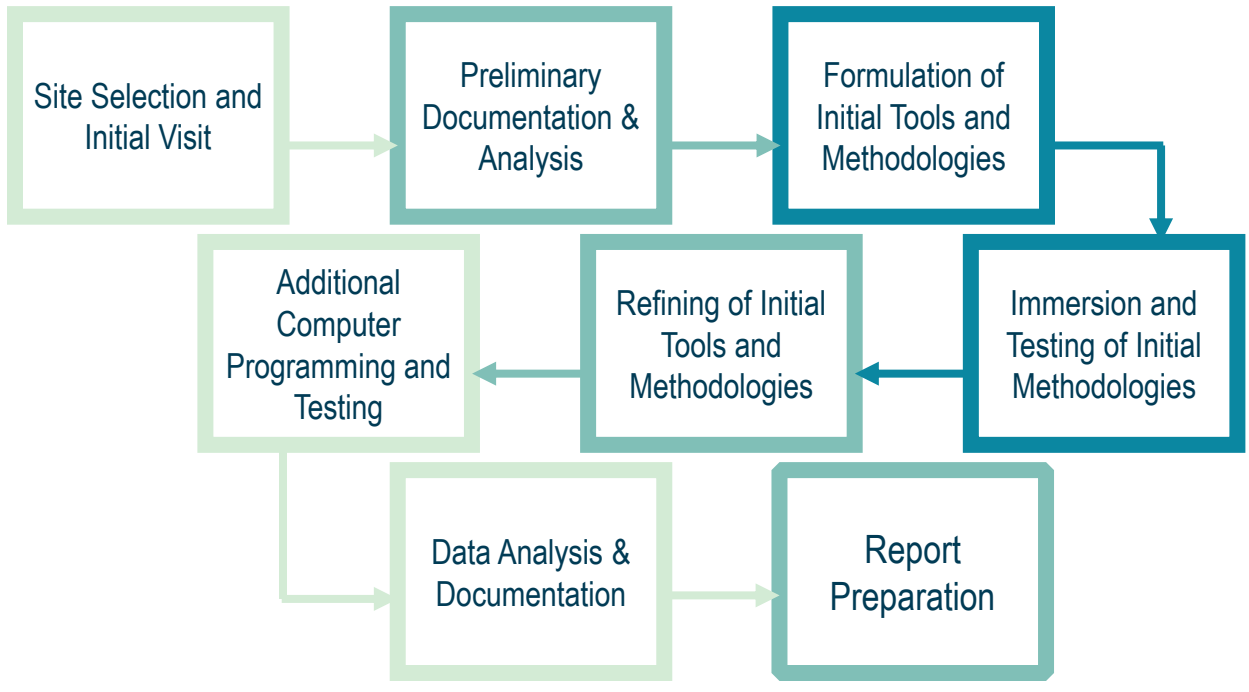

# CADSRR: RE<sub>x</sub>

## National Land Records Modernization Programme (India)

- Includes automation/resurvey of cadastral maps using modern cadastral techniques.
- Land records data are available as (a) textual data, and (b) spatial data (cadastral maps).
- Existing paper maps converted into GIS-ready digital format and then integrated with corresponding textual data.
- Cadastral Survey/Resurvey were carried out using modern surveying technologies namely GPS/ETS, high-resolution satellite imagery and aerial photogrammetric approach depending up land terrain and existing map.

# CADSRR: Methodology

# CADSRR: Immersion

- Familiarize and review the current practices in the survey records reconstruction of the selected Regional Offices.
- DENR Regional Offices: III, NCR, CALABARZON & MIMAROPA

# CADSRR: Immersion

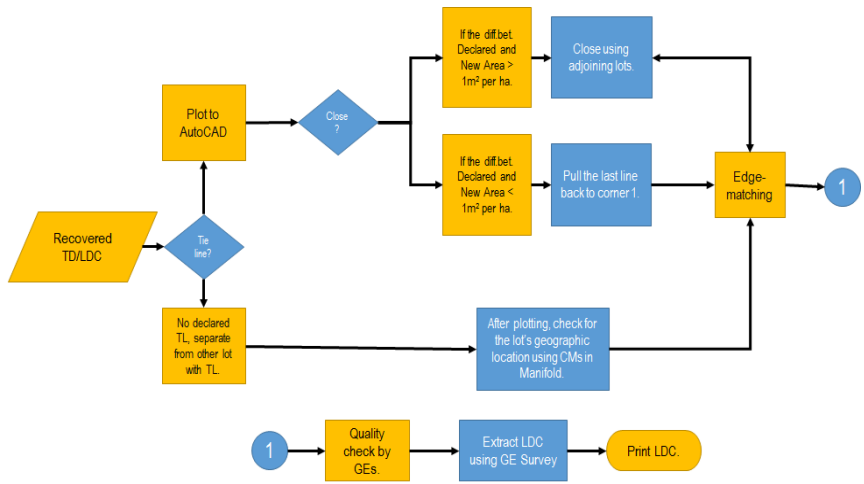

- Consultation with LMB-LAMS

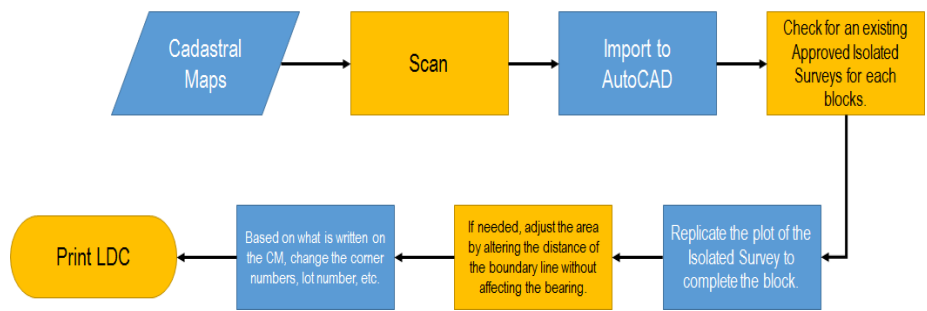

# CADSRR: Immersion

## Region III

## CALABARZON

## NCR

# CADSRR: Immersion

RECONSTRUCTION ACTIVITIES PER REGION				
	III	CALABARZON	MIMAROPA	NCR
Data	Bearing-distance data, Coordinates	Bearing-distance data, Coordinates, Cadastral and Projection Maps	Coordinates from LMB and Private GEs	Bearing-distance data, Coordinates of Cadastral Lots
Encoding/Plotting	Excel → AutoCAD	AutoCAD	AutoCAD	AutoCAD (GE Survey)
Error of Closure	Adjustments with the aid of Excel	Graphical Adjustment (allowable area difference must not exceed 1m <sup>2</sup> /ha)	-	Graphical Adjustment (allowable linear error of closure must not exceed 0.01m)
Edge Matching	Area Solver, TD Matcher Adjustments in Excel	Adjustments in Manifold (CMs, PMs and DCDB as basis)	-	Adjustments in AutoCAD (Approved isolated surveys as basis)

*Disclaimer: Data was collected during the months of March, April and May of 2018*

# CADSRR: Immersion

RECONSTRUCTION ACTIVITIES PER REGION				
	III	CALABARZON	MIMAROPA	NCR
Strengths	Systematic way of reconstructing lots	Fast-paced work for reconstruction of lots	Local GEs providing them with data containing coordinates	Old Cadastral Maps contain distances and bearings for lot lines
	Always aim to return the same technical description with respect to its source	Utilizes Manifold for observation of Cadastral Maps overlaid by the lot data		Use of database for linkage of reconstructed lots
Weakness	Tedious and lengthy procedure	Technical description does not always match from its sources	Reconstruction is still limited to data obtained from Lot Data Computation Sheets	Limited data

*Disclaimer: Data was collected during the months of March, April and May of 2018*

# CADSRR: GIS Based Solutions

Coordinate Data (Lot Data Computation Sheet)

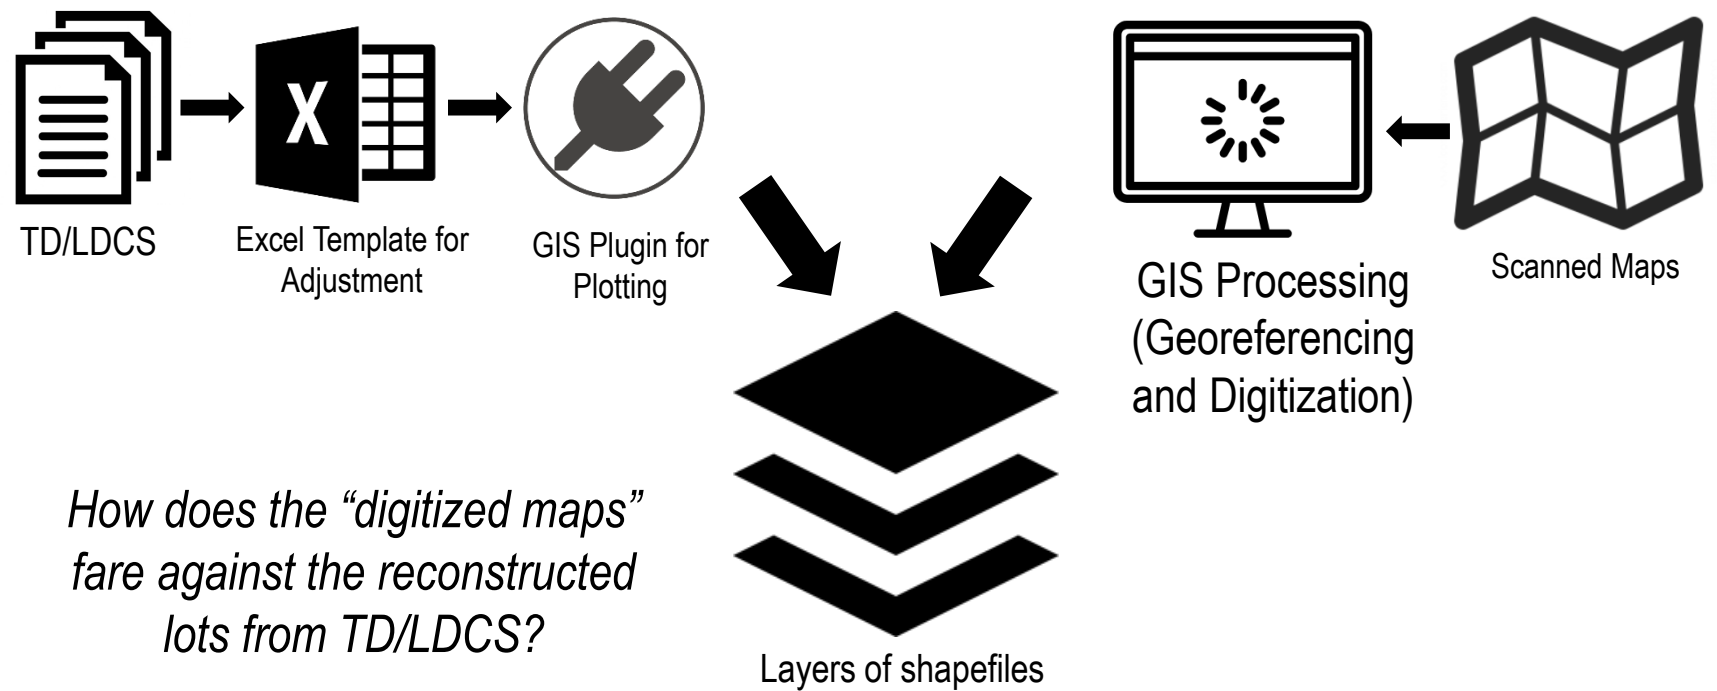

Bearing-Distance Data (Technical Description)

Scanned Maps (Cadastral Maps, Projection Maps, etc.)

# CADSRR: GIS Based Solutions

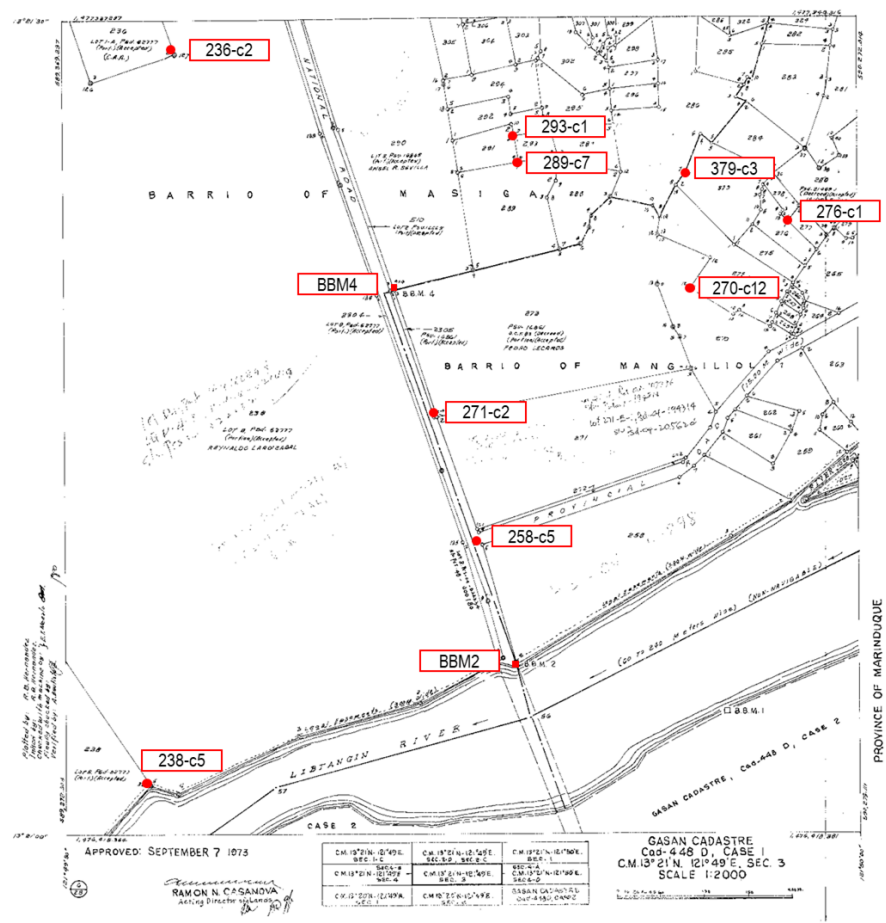

*How does the “digitized maps” fare against the reconstructed lots from TD/LDCS?*

# CADDSRR: Outputs

## Data Templates

- Regional offices encode two kinds of textual data as part of their survey reconstruction activities
  - *coordinates from lot data computation sheets*
  - *bearing-distance data from technical descriptions*
- Developed two spreadsheet templates for these data which can also perform accuracy checks.
  - *Bearing-Distance Template*
  - *Coordinates Template*

# CADSRR: Outputs

## Data Templates: Bearing-Distance

- If the Linear Error of Closure is greater than the **user-defined tolerance**, an error message will appear and corrections should be done to close the lot.
- The template will produce a new technical description with adjusted values and also some suggested corrections in the directions.

# CADSRR: Outputs

## Plugin: Cadastral Plot

# CADSRR: Outputs

## Plugins: Cadastral Plot

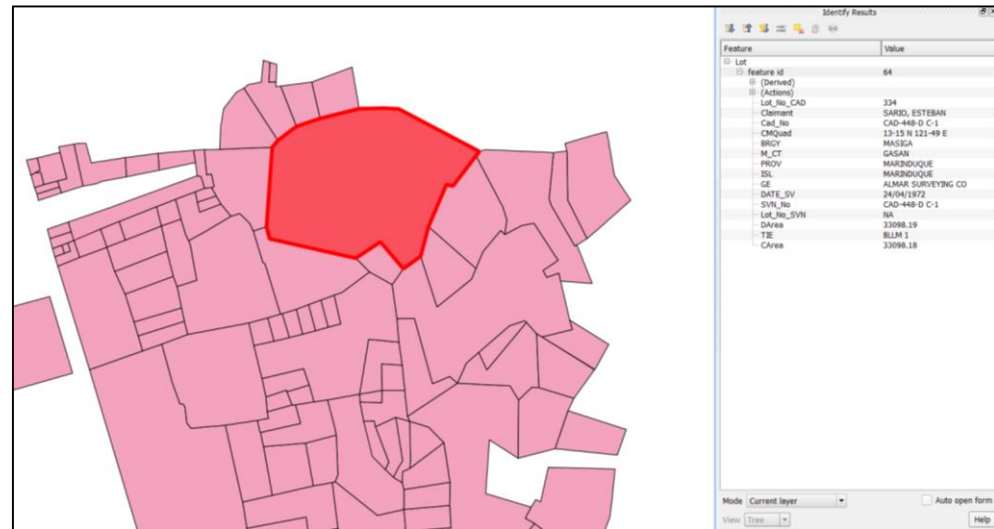

- **CadastralPlot** is a QGIS plugin that plots cadastral data (technical descriptions and lot data computation) into a shapefile. Accepts **spreadsheet files** (.xls/.xlsx) with specialized format.

# CADSRR: Outputs

## Plugins: Cadastral Plot

- The output shapefile of this plugin has the capacity to store the geographic location, shape, and other associated attributes of the lot such as lot number, claimant, area, date surveyed, GE who performed the survey, barangay, province, etc.

## Plugins: Lot Raster Clipper

# CADSRR: Outputs

## Training Modules

### Module 1: QGIS Plugin System

One of the advantage of QGIS from other GIS software is the active community who support it. QGIS offers a library of useful features called plugins. The plugins are created by QGIS developers and other independent users who want to extend the functionality of the software. These extensions are free and available for all users.

#### Objective

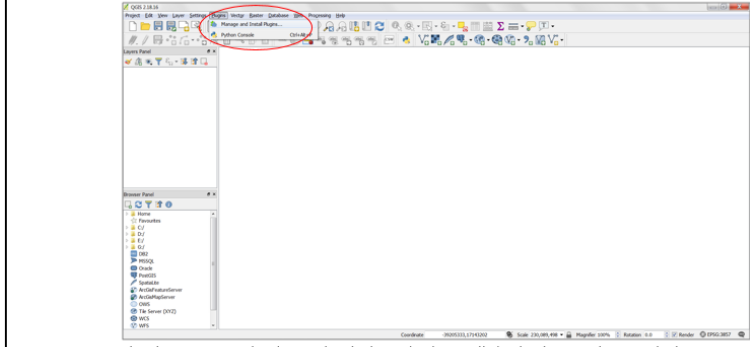

This module covers the basics which includes downloading, installing, and activating plugins. After this module, users will be familiarized with the QGIS plugin system, specifically on how to use the *QGIS Plugin Installer* and *Plugin Manager* tool. Users will also learn how to locate the plugin from the QGIS menu once they are installed.

#### Managing Plugins

There are two kinds of QGIS plugins, "Core Plugins" and "External Plugins". Core plugins are already part of the standard QGIS installation. To use these, users only need to enable it. On the other hand, external plugins must be installed prior to use. These are available in the *QGIS Plugins Repository*. An easy way to browse and install these plugins is by using the Plugin Manager tool.

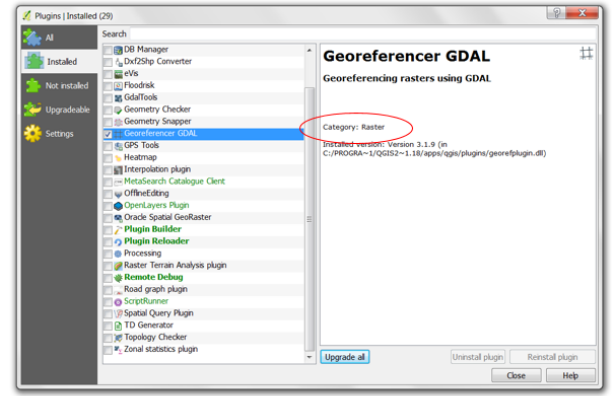

#### Enabling Core Plugins

1. Open QGIS. To open the Plugin Manager, click on *Plugins* → *Manage and Install Plugins*.

2. First time users may already see a lot of plugins under the Installed Tab. These are the Core plugins installed during the QGIS installation.
3. Find the *Georeferencer.GDAL* plugin. Check the checkbox besides the icon to enable the plugin.

for clues. Here the description says *Category Raster*. That indicates that the plugin would be found under the Raster menu once enabled.

4. After activating the *Georeferencer GDAL* plugin, go to *Raster* → *Georeferencer* → *Georeferencer* to use the added functionality of the plugin.

## Training Modules

### Module 2. Georeferencing and Digitizing in QGIS

#### 2.1 Georeferencing a Map

Updating the information of a land area is a fairly common task in land management. Analog collection of data, some of which dating several years back, necessitates the shift to digitization of the inventory data.

For instance, users would typically use the information in GIS to compare with later inventories. Thus, the information at hand must be first digitized using the GIS software. However, before the digitization procedure, an important first step must be done – scanning and georeferencing the paper map.

#### Objective

The goal for this section is for the user to learn how to operate the Georeferencer tool in QGIS.

#### Scan the map

The first task in georeferencing is scanning the map. Large maps can be scanned in different parts. Note however, that users need to repeat preprocessing and georeferencing tasks for each part. Thus, it is recommended to scan the map in as few parts as possible.

Users may use their own maps for the purposes of this manual. Scan the map as an image file with a resolution of at least 300 DPI. For colored maps, scan the image in color for additional information. Color shades in the inventory maps can be used to separate information into different layers (e.g. forest stands, contour lines, roads).

For this module, users may use a previously scanned map, titled `sample_map.tif` and located in the data folder `module2_data/georeferencing`.

#### Georeferencing the scanned map

1. Open QGIS. The project's CRS must be set to PRS92 in *Project* → *Project Properties* → *CRS*. Note that PRS92 is the CRS currently used in the Philippines.
2. Save the QGIS project as `map_digitizing.qgs`. Since we will be working on data with another CRS, confirm if Enable 'on the fly' CRS transformation is checked.

3. The georeferencing plugin from QGIS will be used. Recall that it is already installed in QGIS. Using the plugin manager, activate the plugin similar to the steps in the previous module. The plugin name is Georeferencer GDAL.
4. To georeference the map:
  - Launch the georeference tool, *Raster* → *Georeferencer* → *Georeferencer*.
  - Add the map image file, `sample_map.tif`, as the image to *georeference*, *File* → *Open raster*.
  - Find and select the Luzon 1911/Philippines zone III CRS when prompted. This is the CRS that was used in 1973 when this map was created.
  - Click OK.
5. Next, define the transformation settings for georeferencing:
  - Open *Settings* → *Transformation settings*.
  - Click the icon next to the Output raster box, go to the folder and create the folder `training_output/module2` and name the file as `sample_georef.tif`.
  - Set the rest of parameters the same as below.
  - Click OK.

## Training Modules

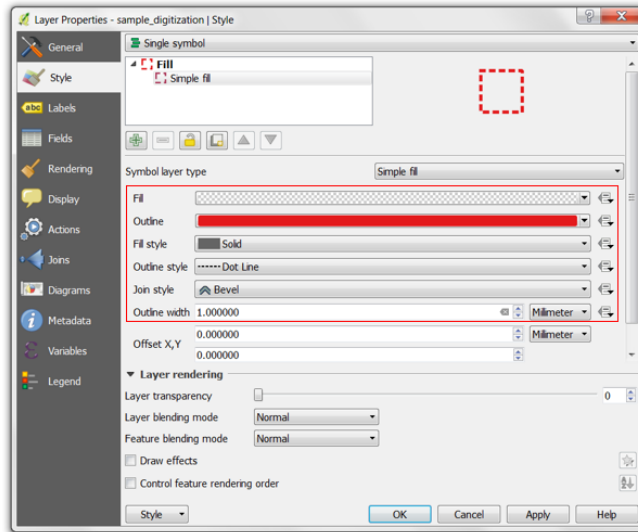

### Symbology

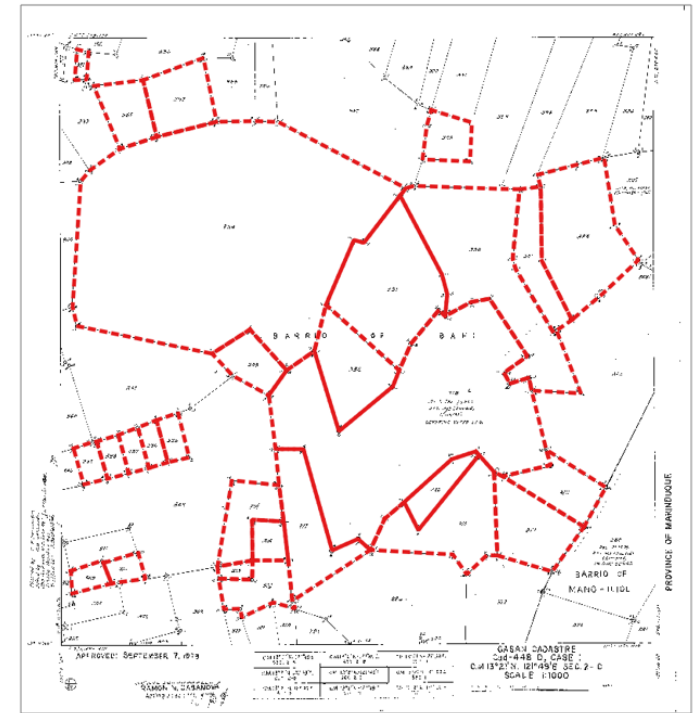

Symbology can be defined as the visual appearance of a geographic information on the map. One of the core strengths of GIS is its ability to represent data in many forms and styles.

To change a layer's symbology, right-click on the layer → Properties and select the Style tab.

- Change the symbology of your digitization output into red dotted line with no fill.
- Select *Simple Fill*. Set the parameters the same as below

- The output should look like this:

In the current survey records reconstruction efforts of DENR-LMB, lots reconstructed through digitizing georeferenced maps are categorized as **non-survey data**.

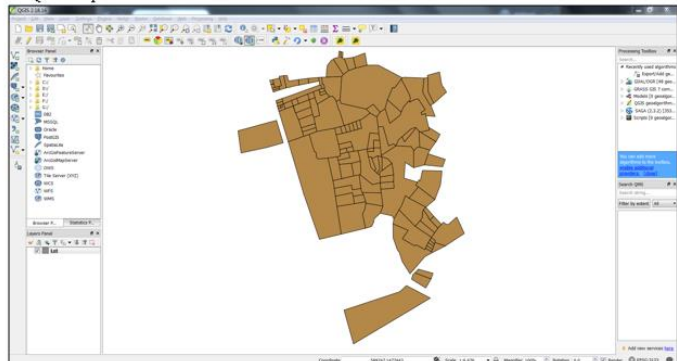

Module 3. Cadastral Survey Records Reconstruction Application

# CADSRR: Outputs

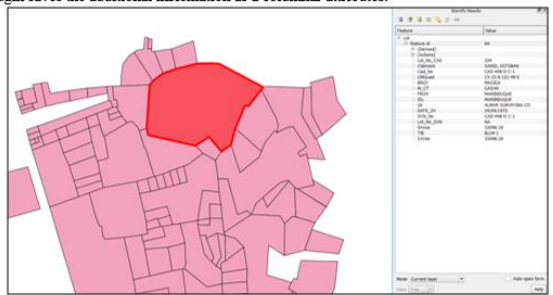

## Training Modules

5. Lastly, select the destination folder of the output file. After running the plugin, the plot will appear in the QGIS Map View window.

6. The plugin saves the additional information as a columnar attributes.

ID	AREA	PERIMETER	SHAPE	SHAPE_LENGTH	SHAPE_AREA	SHAPE_PERIMETER	SHAPE_LENGTH	SHAPE_AREA	SHAPE_PERIMETER
1	1000.00	1000.00	1000.00	1000.00	1000.00	1000.00	1000.00	1000.00	1000.00
2	2000.00	2000.00	2000.00	2000.00	2000.00	2000.00	2000.00	2000.00	2000.00
3	3000.00	3000.00	3000.00	3000.00	3000.00	3000.00	3000.00	3000.00	3000.00
4	4000.00	4000.00	4000.00	4000.00	4000.00	4000.00	4000.00	4000.00	4000.00
5	5000.00	5000.00	5000.00	5000.00	5000.00	5000.00	5000.00	5000.00	5000.00
6	6000.00	6000.00	6000.00	6000.00	6000.00	6000.00	6000.00	6000.00	6000.00
7	7000.00	7000.00	7000.00	7000.00	7000.00	7000.00	7000.00	7000.00	7000.00

9	9000.00	9000.00	9000.00	9000.00	9000.00	9000.00	9000.00	9000.00	9000.00
10	10000.00	10000.00	10000.00	10000.00	10000.00	10000.00	10000.00	10000.00	10000.00

### Shapefile Format

CadastralPlot plugin converts the information inside the text file into a shapefile format. The shapefile format consists of 3 primary files with the same name, but the following file extensions:

- .shp** - contains the spatial information, namely, x,y coordinate pairs which describes the point, line or polygon features contained in the file.
- .dbf** - contains the attribute information, or the descriptive characteristics of the features.
- .shx** - links the .shp and .dbf file. It matches up the correct row in the .shp file with the correct record in the .dbf file. The shapefile will not work properly without these 3 files.

The output shapefile of the plugin also contains a .prj, .qpr and .cpg file. The .prj and .qpr contains the coordinate system and projection information. These file are necessary for correct positioning of data with respect to other spatial data, and for measuring and calculating distance. The .cpg file is an optional plain text files that describes the encoding applied to create the shapefile.

# CADSRR: Recommendations

## Cadastral Survey Reconstruction

The step and approach in reconstruction of records shall depend on the source data or records identified during the research process.

Condition	Numerical	Graphical (CM, PM)
Case 1	✓	✓
Case 2	✓	-
Case 3	-	✓

- The output can be categorized into 2: survey-accurate and non-survey-accurate data.
- **Survey Accurate** – reconstructed from numerical data
- **Non-Survey Accurate** – extracted from maps

\*CM – Cadastral Map

\*PM – Projection Map

# CADSRR: Recommendations

## Cadastral Survey Reconstruction

### Case 1: Both Numerical and Graphical Data are available

- Numerical data will be used for reconstruction while graphical data will serve as basis for cleansing (identification and correction of erroneous, gaps and overlaps).

Condition	Recommendations
Error of Closure	<ul style="list-style-type: none"><li>The maximum allowable error of closure is <b>2.50%</b> of the area (<i>for reconstruction purposes only</i>). Once the data of its adjoining lots becomes available, the lot can be reconstructed <b>by extracting its corners from its surrounding lots</b>.</li></ul>
Erroneous/Missing Tie Line Description	<ul style="list-style-type: none"><li>Using adjoining lots.</li><li>Overlaying a <b>georeferenced map</b> where the map will guide the <b>translation of the displaced lot</b>.</li></ul>

# CADSRR: Recommendations

## Cadastral Survey Reconstruction

### Case 2: Only Numerical Data are available

- For lots with missing or erroneous tie lie description, place it in a **separate layer for cleansing**.
- Cluster the lots by block and according to number to easily translate them all at once. Use **adjoining lots** for edge matching.

# CADSRR: Recommendations

## Cadastral Survey Reconstruction

### Case 3: Only Graphical Data are available

- In case there are **no numerical data** present, **georeferenced map** can be **digitized** to extract lot data. These reconstructed lots will fall under the **non-survey accurate** category and will be stored in a separate layer.
- Digitized data **cannot** be used as **substitute for re-survey** and will only be used for the **completion of DCDB**.
- Digitized data will be **connected to a reference point** nearest to the lot cluster.
- Digitized data can be extracted from High Definition Orthophotos, where possible boundaries can be extracted.

# CADSRR: Recommendations

## Cadastral Survey Reconstruction

### Case 3: Only Graphical Data are available

Condition	Recommendations
Georeferencing	<ul style="list-style-type: none"><li>Use the map corners as GCPs and apply the given map projection. For the sampling method and transformation algorithm, use Cubic and 1st Order Polynomial respectively.</li></ul>
Establishment of Base Project	<ul style="list-style-type: none"><li>If two adjacent maps have different scales, the large scale map will be the basis of adjustments for adjacent smaller scale maps.</li><li>If two adjacent maps have the same scale, the map with a lower RMSE, in terms of Georeferencing, will be the basis of adjustment.</li></ul>
Manner of Digitization	<ul style="list-style-type: none"><li>Add vertices on the center of corner's circle and follow the corner numbers (always start at corner 1).</li><li><b>Another layer to indicate assumed boundary lines</b> that is subject for further validation and amendments.</li></ul>

# CADSRR: Possible Future

- Extend the plugins' input and output to several type of files, making it **compatible** to various format such as **variations of spreadsheet files** for input and output of the **Cadastral Plot and TD Generator Plugins**, respectively. (dbf format, LAMS Spreadsheet)
- TD Generator plugin for **multiple shapefiles** consisting of varying survey numbers, beneficial for **filling the adjoining lot column**.

*“The application of GIS is limited only by the imagination of those who use it.” - Jack Dangermond*
